

Lifting Mainsail Operation

Instructions

1. Unzip boom bag
2. Climb steps on mast to access and release the shock cord holding mainsail down and release the other shock cord connected to the lazy jacks
3. Release main halyard clutch brake
4. Wrap two turns around windlass
5. Remove chain from capstan before pushing down on the footswitch

Lifting Mainsail

1. Whilst the anchor winch can lift the mainsail all the way up to save time initially pull the sail up as far as possible by hand
2. Check the cam brakes on the boom to ensure they are free to allow the reefing lines to run smoothly as the sail is lifted
3. Ensure the boat is facing into the wind as you lift the mainsail. For night sailing always put a reef in the mainsail.
