

# Chart Plotter Operation

## Instructions

1. Turn on VHF, Autopilot and GPS toggle switches at the switchboard to provide power to those instruments.
2. The chartplotters also have an on button and you will need to press this for the required time to start it up. It is not necessary to press this button to turn off the plotter when you have finished and can simply turn off the power at the switchboard. This way when you repower the plotter it will automatically turn on. It takes a minute for the screen to come on.
3. Next select the screen you want to use which is generally the Chart screen. The other options are shown by pressing the Home button. You have many optional screens such as Fishfinder, Data, Camera, Radar, etc.
4. For detailed operation of the chartplotter do a Youtube search and you will find excellent instructions on the operation. The chartplotter also has an inbuilt manual.
